

Experience

Oxford Universities Motorsport Foundation (OUMF) – Member

OUMF is a volunteer student run foundation that works on restoring, modifying and racing classic rally and circuit cars.

Teamwork – Engaged in a team environment, working to complete projects in time for deadlines. While also functioning as an individual to carry out ad-hoc tasks pertaining to event preparation such as cleaning, sanding and painting equipment.

Sheet Metal Fabrication – Designed and fabricated various bespoke sheet metal bracketry for the cars and HQ.

Vehicle Maintenance – Performed post-race spanner checks on the vehicles, repainting parts, engine valve-lapping and assisting with engine rebuilding.

Royal Mail – Temporary Mail Sorter (12/2023 - 01/2024)

Temporary Christmas mail sorting role. Responsible for sorting incoming mail into designated carts to be shipped off to their destination.

McDonalds – Team Member (01/2021 – 08/2022)

Part-time job during sixth form, sorting orders, restocking and cleaning the lobby.

Education

Oxford Brookes University: Motorsport Engineering (BEng), 08/2022 - 05/2026; First Class Honours

- | | |
|--|--|
| - Design and practice II, 77% / A+ | - Materials Engineering, 78% / A+ |
| - Engineering Mathematics and Modelling II, 77% / A+ | - Electronics and Control Engineering, 70% / A |
| - Stress Analysis, 82% / A+ | - Engineering Dynamics, 73% / A |
| - Thermo-fluids, 91% / A+ | - Powertrain Engineering, 87% / A+ |
| - Vehicle Dynamics, 66.95% / B+ | - Vehicle Aerodynamics, 66.7% / B+ |
| - Engineering Project, 76.4% / A+ | - Motorsport Vehicle Performance, 71.1% / A |

Barton Peveril Sixth Form College (08/2020 – 05/2022)

Maths : B

Physics : C

Computer Science : C

English : A

Technical Skills

Engineering Drawings & CAD/CAE – Experienced with SolidWorks and Fusion 360 and able to interpret and produce engineering drawings.

Some CAD assemblies I've built:

Design for Manufacturing – Familiar with design principles for sheet metal and machined components. Currently undertaking a Go-kart design and manufacturing project involving considerations for manual lathe turning, milling, sheet metal and tube fabrication.

Reverse Engineering – Able to recreate a part or assembly in CAD for the purpose of reproduction or adapting new parts for extended functionality. Recent projects involve recreating a gearbox in CAD and printing a new housing to modify the OEM attachment points.

Some various projects showcasing my approach to problems and skills used:

	Project: Clutch Alignment Tool Problem: Motorbike mechanic was working on a classic Russian motorbike and needed an alignment tool for the clutch plates. The tool would've cost £60~ and would've taken at least a week to ship from Russia. Solution: I took the clutch plates, modelled the spline pattern in CAD and printed a replica tool within an hour for about 30 pence in material. Saving him £60 and a week.
 	Project: OUMF Riley Kestrel 1100 Mesh Insert Problem: The 1100 has a critical design flaw causing premature deterioration via leaves irrevocably entering the cowl vent. Solutions exist that cover the vent, but don't look aesthetically pleasing. Solution: I mapped the geometry of the vent in CAD and designed a mesh insert that slides under the slots and secures itself up into the slots. The chairman of the 1100 club was asked if he noticed anything different with the front of the car. He was unable to spot it even when guided to the bonnet
	Project: OUMF Malpassi Fuel Filter Bracket Problem: A Malpassi fuel filter needed to be mounted somewhere in the engine bay of the TVR. Solution: Designed a custom aluminium bracket utilizing pre-existing oil tank mounting points. Mapped the geometry onto a paper template, cut out aluminium using a guillotine, drilled mounting holes, and hand-polished the surface.

More projects available on my LinkedIn page.
